

Intro

Period: 2
Name: Ivan Zheng
Group: Gold Digger
Project Title: Treasure Climber

Description

Treasure Climber is a game inspired by Doodle Jump. Its mineshaft aesthetic will be added once the basic mechanics are implemented. The idea is that the player controls a character (current idea is a “slime”) by moving left and right to help it land on platforms to reach the surface and escape the mine (if the game ends up being endless, there will be no surface). There will be a score based on how high the player goes. The game ends when the player falls below the screen.

(The amount of columns in the actual game might be changed)

Some possible features to be implemented include:

- coins to collect to increase the score
 - some platforms may have bundles of coins to further increase the score
- powerups
 - magnet: adds a “forcefield” to make it easier to collect coins
 - timer: slows down the game to make it easier to jump
 - jetpack: propels the player upward to increase the score
- different platform types
 - trapdoor: opens if the player lands on it once
 - conveyor: moves back and forth
 - spikes: ends the game if the player lands on it

UML Diagram

Directions

The player starts at the bottom of the mine and does not move until the player presses either the left or right arrow key. Once the player presses an arrow, the character will keep moving in that direction until it hits the side of the screen, in which case it will turn back, or the player presses the other arrow key. There might be an option to press the spacebar instead to flip the direction if the player prefers one button over two.

The objective of the game will be either reaching the surface or getting the highest score, depending on whether the game ends up being endless (there might be a mode feature so that both options exist).
